

A Demonstration of the Texas Energy Water Simulator

Faeth, Paul

Center for Naval Analyses

In 2011, Texas experienced the worst drought in state history, and came close to power blackouts as a result. To explore water use in the power sector, CNA developed an on-line simulator for Texas that allows any user to change assumptions about ways to supply electricity as well as future demand, and see the results for water use and CO2 emissions. The Texas Energy-Water Simulator will be demonstrated during this session. Bring your computers or iPads.
